### **Voice feminization surgery with glottoplasty**

Although conservative voice feminization treatments including medical voice therapy and socio-cultural vocal coaching are essential and important parts of the holistic transition process, there still remains a high proportion of females who can and will benefit from surgical pitch raising surgery. The focus of this talk will be on the benefits of glottoplasty, which was introduced by Professor Wendler and modified by others later on. Additional measures will be addressed briefly such as our multidisciplinary approach to support the transition process.
